Gastrointestinal Hamartomatous Polyposis Syndromes

- **Hamartoma**: a non-neoplastic tumor with a markedly distorted architecture composed of an abnormal mixture of cells and tissue normally present in that particular area
- **Diagnosis**: based on the presence of a **pathogenic germline variant or meeting clinical criteria** for the syndrome

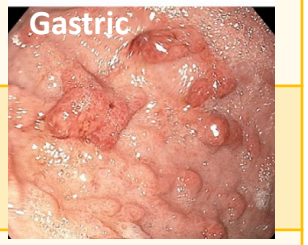
Peutz-Jeghers Syndrome

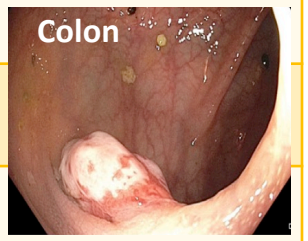
Clinical Features	• **Mucocutaneous freckling** around the mouth • Multiple **cerebriform-appearing polyps** due to smooth muscle bands coursing through the polyp • Autosomal dominant inheritance | Associated gene: STK11
Conditions Prompting Genetic Evaluation	• Presence of ≥ **2 histologically confirmed Peutz-Jeghers polyps** • First-degree relative with Peutz-Jeghers and any number of Peutz-Jeghers polyps • Family history of Peutz-Jeghers syndrome and presence of characteristic mucocutaneous pigmentation • Any number of Peutz-Jeghers polyps and the presence of characteristic mucocutaneous pigmentation
Organs for Cancer Surveillance	• GI: stomach, small bowel, colon, pancreas • Additional: lungs, breast, ovaries, cervix, uterus, testes
Surveillance of the Stomach, Duodenum, and Colon	• **Start at age 8-10 years**: baseline EGD and consider colonoscopy at the same time • If **(+)** Peutz-Jeghers Polyps: repeat **EGD and colonoscopy every 2-3 years** • If **(-)** Peutz-Jeghers Polyps: repeat at **age 18 years** (earlier if symptomatic) and then **every 3 years**
Small Bowel Surveillance: How and When	• **Start at age 8-10 years** (earlier if symptomatic): baseline surveillance with video capsule enteroscopy or magnetic resonance enterography • **Age 18 years: resume surveillance** if no polyps found on the initial examination • Adulthood: **surveillance every 2-3 years** due to risk of small bowel intussusception
Small Bowel Polypectomy	• Remove **symptomatic polyps** and **polyps ≥ 10 mm** to prevent intussusception and other complications, such as bleeding
Pancreatic Cancer Surveillance	• **Begin at age 35** and perform annually with either magnetic resonance cholangiopancreatography or endoscopic ultrasound

Am J Gastroenterol. 2022 Jun 1;117(6):846-864.

Juvenile Polyposis Syndrome

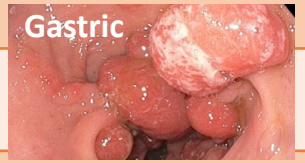
Clinical Features	• **Inflammatory polyps with a smooth red surface** • Autosomal dominant inheritance | Associated genes: SMAD4 or BMPR1A
Conditions Prompting Genetic Evaluation	• Presence of ≥ **5** juvenile polyps of the **colon or rectum** • Presence of ≥ **2** juvenile polyps in **other parts of the gastrointestinal tract** • Presence of any number of juvenile polyps and ≥ 1 first-degree relatives with juvenile polyposis syndrome
Organs for Cancer Surveillance	• Stomach and colon
Surveillance of the Stomach and Colon	• **Start at age 12-15 years** (earlier if symptomatic): baseline EGD and colonoscopy • **Repeat every 1-3 years** depending on polyp burden
Screening for Hereditary Hemorrhagic Telangiectasia (HHT)	• **Evaluate** those with **SMAD4** pathogenic variants for **HHT** at the time of diagnosis • Including screening for and appropriate management of cerebral and pulmonary AVMs





PTEN Hamartoma Tumor Syndrome

Clinical Features	• Phenotypic variations: Cowden Syndrome, Bannayan-Riley-Ruvalcaba syndrome, Proteus Syndrome • Hamartomas of the **skin and gastrointestinal tract**, mucocutaneous lesions, and macrocephaly • Autosomal dominant inheritance | Associated gene: PTEN (additionally WWP1 in Cowden-syndrome like Syndrome)
Conditions Prompting Genetic Evaluation	• Presence of **multiple gastrointestinal hamartomas or ganglioneuromas** should prompt evaluation for Cowden's syndrome and related conditions
Organs for Cancer Surveillance	• GI: colon • Additional: breast, thyroid, kidney, uterus, and skin
Surveillance of the Colon	• **Start at age 35 years** (or 10 years younger than age of any relative with colorectal cancer) • **Repeat at intervals ≤ 5 years** depending on polyp burden



Hereditary Mixed Polyposis Syndrome

Clinical Features	• Attenuated colonic polyposis of varying types and histologies • Autosomal dominant inheritance | Associated gene: GREM1 • **Start at age late 20s: colonoscopy** (onset of polyposis) • Not enough data to know optimal surveillance intervals or if there is extraintestinal neoplasia risk
